

Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date	1 October 2026
Team ID	SWTID-2026-8511
Project Name	Implement Client Script and UI Policy (Incident)
Maximum Marks	4 Marks

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Incident Creation	Open the Incident form from the Incident module Enter caller, short description and category Auto-fill default values on form load
FR-2	Dynamic Form Behaviour (UI Policy)	Show or hide fields based on Category or State Make fields mandatory based on Priority or State (e.g., Resolution notes when Resolved) Make fields read-only when the incident is Closed
FR-3	Form Validation (Client Script)	onLoad: set defaults and show form messages onChange: alert or auto-fill when fields like Priority, Impact or Urgency change onSubmit: validate details and stop the submit with a clear message
FR-4	Configuration and Administration	Create, activate and deactivate UI Policies on the Incident table Create, activate and deactivate Client Scripts on the Incident table Set conditions and execution order for the rules
FR-5	Testing and Verification	Test every rule with sample incidents Confirm fields, messages and validations behave as expected Fix issues and re-test before use

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	The Incident form is simple to use. Messages are short and clear, and only relevant fields are shown.
NFR-2	Security	Only users with the administrator role can create or change UI Policies and Client Scripts. Client-side rules do not expose sensitive data, and server-side access controls still apply.
NFR-3	Reliability	Rules apply the same way every time the form loads, changes or is submitted, and the UI Policies and Client Scripts do not conflict.
NFR-4	Performance	Rules run on the client without a noticeable delay. Client Scripts avoid heavy server calls.
NFR-5	Availability	The rules are available whenever the ServiceNow instance is available. A rule can be deactivated quickly if it causes a problem.
NFR-6	Scalability	New rules and fields can be added, and the same approach can be reused on other tables, without redesign. Many agents can use the form at the same time.
