

Project Design Phase

Solution Architecture

Date	1 October 2026
Team ID	SWTID-2026-8511
Project Name	Implement Client Script and UI Policy (Incident)
Maximum Marks	4 Marks

Solution Architecture:

Solution architecture is a complex process, with many sub-processes, that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Solution Architecture Diagram:

Figure 1: Architecture and data flow of the Incident form with UI Policy and Client Script

1. The caller reports an issue and the service desk agent starts a new incident.
2. The agent opens the Incident form in the ServiceNow platform UI.
3. The UI Policy shows or hides fields and makes them mandatory or read-only as the agent fills the form.
4. The Client Script reacts to field changes (onChange) and validates the details when the agent submits (onSubmit).
5. The validated incident is passed to the server-side logic, where Business Rules and ACLs still apply.
6. The incident is saved in the Incident table.
7. The incident is assigned to the resolver group and the caller is notified by email.
8. The administrator creates and maintains the UI Policy and Client Scripts.
